

AfroDebab Hiring Workflow Documentation

Job Application, Candidate Selection, Auto-Rejection, Hiring,
Employee Profile Creation, and Email Notifications

1. Overview

The AfroDebab platform has a job application feature where HR/Admin can create job postings, and applicants can apply for available jobs.

This document explains the full hiring workflow that needs to be implemented.

The workflow includes:

1. Applicant submits a job application.
 2. HR/Admin reviews all applicants.
 3. HR/Admin selects one or more candidates for interview.
 4. The system automatically rejects applicants who were not selected.
 5. The system sends email notifications to selected and rejected candidates.
 6. Interviews happen manually outside the system.
 7. HR/Admin selects one candidate as hired.
 8. The system automatically rejects the other interviewed candidates.
 9. The system sends email notifications to the hired candidate and rejected interviewed candidates.
 10. The system creates an employee profile for the hired candidate.
-

2. Main Actors

2.1 Applicant

The applicant can:

- View available job postings.
 - Apply for a job.
 - Submit personal information.
 - Upload or provide a resume.
 - Receive email notifications about application status.
-

2.2 HR/Admin

The HR/Admin can:

- Create job postings.
 - View applicants for each job.
 - Review applicant information.
 - Select candidates for interview.
 - Hire one candidate after manual interview.
 - Trigger automatic rejection of other candidates.
 - View employee profiles created from hired candidates.
-

3. Main Workflow Summary

Job Created

↓

Applicant Applies

↓

Application Status = APPLIED

↓

HR Reviews Applications

↓

HR Selects Candidates for Interview

↓

Selected Candidates = SELECTED_FOR_INTERVIEW

↓

Send Interview Selection Email

↓

Non-selected Applicants = REJECTED

↓

Send Rejection Email

↓

Manual Interview Outside System

↓

HR Marks One Candidate as HIRED

↓

Send Hired Email

↓

Other Interviewed Candidates = REJECTED

↓

Send Post-Interview Rejection Email

↓

Employee Profile Created

4. Application Statuses

Each job application should have a status.

Recommended enum:

```
public enum ApplicationStatus {  
    APPLIED,  
    UNDER_REVIEW,  
    SELECTED_FOR_INTERVIEW,  
    REJECTED,  
    HIRED  
}
```

4.1 Status Description

Status	Description
APPLIED	Candidate submitted the job application.
UNDER_REVIEW	HR/Admin is reviewing the application. This status is optional.
SELECTED_FOR_INTERVIEW	Candidate was selected for interview.
REJECTED	Candidate was rejected.
HIRED	Candidate was hired for the job.

5. Employee Profile Status

When a candidate is hired, an employee profile should be created.

Recommended enum:

```
public enum EmployeeProfileStatus {  
    ACTIVE,  
    INACTIVE  
}
```

6. Email Notification Status

The system should track email notification status.

Recommended enum:

```
public enum EmailNotificationStatus {  
    PENDING,  
    SENT,  
    FAILED  
}
```

7. Business Rules

7.1 Applicant Applies for Job

When an applicant submits a job application, the system should create a new application record.

Default status:

APPLIED

Example:

Candidate A applies → APPLIED

Candidate B applies → APPLIED

Candidate C applies → APPLIED

7.2 HR Selects Candidates for Interview

HR/Admin can select one or more candidates for interview.

When HR selects candidates(can be multiple):

- Selected candidates should change to:

SELECTED_FOR_INTERVIEW

- All other applicants for the same job should automatically change to:

REJECTED

- Selected candidates should receive an interview selection email.
- Rejected candidates should receive a rejection email.

Example:

Candidate A → SELECTED_FOR_INTERVIEW → Send selected email

Candidate B → SELECTED_FOR_INTERVIEW → Send selected email

Candidate C → REJECTED → Send rejection email

Candidate D → REJECTED → Send rejection email

Important: this action should only affect applications for the same job.

7.3 Interview Happens Manually

The interview process will be handled manually outside the system.

The system does not need to manage:

- Interview scheduling
- Interview questions
- Interview scoring
- Interview feedback

For now, the system only needs to track that the candidate is in this status:

SELECTED_FOR_INTERVIEW

7.4 HR Hires One Candidate

After the manual interview, HR/Admin chooses one candidate and marks that candidate as hired.

When HR marks one candidate as hired:

- The hired candidate status should change to:

HIRED

- The hired candidate should receive a hired email.
- All other candidates who were previously selected for interview for the same job should automatically change to:

REJECTED

- Those rejected interviewed candidates should receive a post-interview rejection email.
- The system should create an employee profile for the hired candidate.

Example before hiring:

Candidate A → SELECTED_FOR_INTERVIEW

Candidate B → SELECTED_FOR_INTERVIEW

Candidate C → REJECTED

Candidate D → REJECTED

HR hires Candidate A.

Example after hiring:

Candidate A → HIRED → Send hired email → Create employee profile

Candidate B → REJECTED → Send post-interview rejection email

Candidate C → REJECTED

Candidate D → REJECTED

8. Email Notification Rules

Email should be sent automatically when candidate status changes.

8.1 Email Events

Event	Old Status	New Status	Email Type
Candidate selected for interview	APPLIED or UNDER_REVIEW	SELECTED_FOR_INTERVIEW	Selected for interview email
Candidate rejected before interview	APPLIED or UNDER_REVIEW	REJECTED	Rejection email
Candidate hired	SELECTED_FOR_INTERVIEW	HIRED	Hired email
Interviewed candidate rejected	SELECTED_FOR_INTERVIEW	REJECTED	Post-interview rejection email

8.2 Email Sending Recommendation

Do not send email directly inside the database transaction.

Recommended production flow:

HR/Admin performs action

↓

Application status updates successfully

↓

Database transaction commits

↓

System creates email notification records

↓

Email service sends emails

↓

Email status becomes SENT or FAILED

This prevents email failure from breaking the hiring workflow.
